Abstract—The aim of this paper is to explore the opportunity and possibility to understand the importance of user experience and satisfaction which is an important factor in effective trust in mobile banking in India.

Mobile Banking has been evolving a lot and has increased its market surprisingly in a larger exponential. The growth of the mobile banking technology has increased a lot due to many factors which are important and crucial to today's users. We have been keenly noticing that the users are very dilemmatic when they choose a bank or application and tend more towards the ones which have a better, understanding and a clear user experience.

Keywords—Banking; Design; User Experience Finance; Mobile Application; User Interface

I. INTRODUCTION (HEADING 1)

Customers squander 78 percent of their time using offline banking services. Why would someone will go to the bank just to wait in a long queue just to update their passbook as a customer in Bank? In fact, we wouldn't! We would pick online banking over traditional banking every time if we could conveniently accomplish our banking transactions. We don't have time to spend, and internet banking allows us to perform our banking transactions from the comfort of our couch/sofas or while on a vacation. Theoretically. It isn't nearly that simple in practise. We can't seem to discover my payment history whenever we need it. Going through the all categories available on the m-banking interface sounds so hectic, difficult and complex.

Since it is a necessary step to induce trust and satisfaction for the end users of the banking system. Which comes with the uninterrupted payment

interface, comes along with a lot of things which makes it a relevant system.

In various studies it has been always noticed that there is a massive trust affect and impact of the hassles that are created in the banking systems and the issues that are created due to the mistrust in the privacy, integrity and the performance of the mobile application.

Moreover, Very relevant examples are all the common banking applications holding a dull User experience and having a terrible usage of real estate. We are diving deep in order to understand it in a better way of how are we implementing and understanding these experiences.

II. PROBLEM STATEMENT AND BACKGROUND

Over the Years, Mobile Banking has been evolving a lot and has increased its market surprisingly in a larger exponential. The growth of the mobile banking technology has increased a lot due to many factors which are important and crucial to today's users [1]. We have been keenly noticing that the users are very dilemmatic when they choose a bank or application and tend more towards the ones which have a better, understanding and a clear user experience[2].

Banks, in reality, are moving too slowly toward complete digital offerings. On the one hand, they'll decide to invest a great deal of cash to FinTech; on the opposite, political orientation and forms seriously hamper golf stroke effective FinTech in situ. Banks never realize that their majority of users are using their low quality/Bad user experience application, "worse," that they need to bank using a pill or similar technologies. This is one of the reasons why not all banks provides mobile application because of their complex usability[3].

In fact, there are a few forward-thinking institutions that provide universal digital banking. Also these early adopters, however, confront one further disadvantage: a lack of use and aesthetics[6]. We polled people to find out what their favorite digital experience was. To our amazement, no one noticed the banks interface, despite the fact that it is used by eighteen people every day. Only Financial technology businesses such as Coins and Moven were mentioned in answers. How is this the case?

With their massive resources, banks may get UX professionals in the business to design their application/website, yet we have a tendency to don't get positive outcomes. And maybe not every financial institution is willing to shift from product-centered to consumer thinking. Whatever the cause, this is frequently inconvenient. We decided to offer the UX style Agency team idea of digital banking since it should be for bit displays. A solution we'd be pleased to use to complete our banking! Here is the strategy we took and the resulting solution.

III. SOLVING THE PROBLEM

We examined mobile banking applications and studied the usability of their working techniques and procedures for the objectives of this paper.

Each of these applications have different capabilities to display and control access to local information in the device, as well as many forums and has specific UI design patterns and advanced processes that make it difficult to define privacy controls at UI level that can work effectively. on different applications[8].

The following list is not exhaustive, but it does represent a wide range of mobile phone platforms applications. Although these platforms are used as operating time areas for specific devices, it is important to distinguish between the specification of the platform and the platform[9].

- iOS: This platform has sparked the current popularity of conventional mobile app forums. Version 4 (published in mid-2010), the platform has relocated geolocation controls to the Chrome UI, as well as additional platform capabilities (such as the ability of programs to run in the background depending on location information). Somewhere at moment, iOS is the most popular platform for native mobile apps[4].

- Android: Google Forum has seen the latest growth in popularity and has an open platform model availability: platform code is open source, too accepted by various mobile phone retailers. Numerous manufacturers have sought to broaden the base field with their applications and user interface[5]. Android also has a few UI design guides design and development, leading to less unity user information[7].

These two platforms summarize the most popular platforms available today for the mobile phones, but it is not complete. The objective of this paper is not to offer a comprehensive list of platforms, but to illustrate the notion that the popularity of mobile application platforms is quite diverse and will remain so for the coming years. Despite this a variety of platforms

available, it is instructive to watch the difference between the specification of the platform and the platform.

We have noticed the older versions of the SBI Banking Application, Which makes us understand that the user experiences in older times were very hard that were hard to analyze, but in today's competition era, if this design wasn't updated with a better version, most of the customers of the SBI would have stopped using the digital means and could've switched to a better bank. These are some references from the SBI Banking Application from 2015.

IV. DESIGN PROCESS

When we enter into Designing and developing a better solution, we obviously need Data which helps us in improving the work and insights and feedbacks from the already existing users and their pain points[10].

Experts say that m - banking should be based on the following principles:

1. Personalization
2. Transparency
3. Self-service
4. Mobile first
5. Simplicity
6. Aesthetic
7. Holistic

These concepts will be taken into consideration as we create our strategy and architecture[11]. These will be critical aspects in determining the indication of performance that will be utilized to assess the quality of our product/solution statement.

When we start on designing a better User Interface, we follow a set of instructions, or we may say a set of rules which should

be taken care of to make the UX Memorable[12]. Here is a Look of our UX Design process we always take in reference.

Fig.-2 : UX Design

Once the design process initiates, we make Wireframes- A skeletal structure of the application, a basic low-fidelity wireframe which helps us in knowing the flow of the application before designing it completely.

While interacting with the Users, our main focuses and outcomes are:

1. We should concentrate to customers.

Pay close attention to our users' complaints, problems, and wants. Answer their considerations to seek out the quickest, simplest way to scale back friction whereas increasing satisfaction[24][4]. perhaps it sounds shivery, however attempt to step back from our inner narcissism and assumptions. you may be stunned by what your customers extremely rely on your service.

2. Don't be afraid to interrupt the established order

Review our business standards to seek out a chance window, even though it's solely concerning less complicated and smarter service style.

3. Become customer-centric. Change our company approach from one focused on products to one focused on customers. Deliver service to satisfy your customers' wants in an exceedingly means they perceive, rather than hard-pushing previous stuff mistreatment dear ad campaigns.

4. Upgrade our digital strategy. Discover that channels your customers like and use those to form your service cheaper and appealing.

5. Build our customer's expertise fascinating

Delight along with our service interface, build it easy and up-to-date as a result of within the age of 1,000,000 apps and

on-line services users became spoiled and lazy.

By implementing these principles, pain points and methodologies. We come to a conclusion which helps us having a better design, a better visual interface, with much better User Experience. Lets have a look:

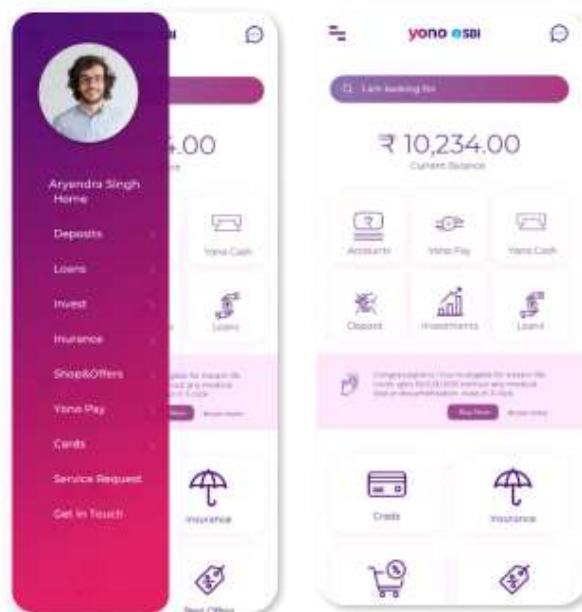

Fig.3: App Design with better User Experience

V. CONCLUSION

Online mobile banking is a key essential topic in today's era. Understanding and improving it was indeed an important aspect of the project. We dive deep into the different aspects of the design and make more intuitive design so that the User Experience is enhanced well and made well.

This UI style resolution was compared with many on-line banking interfaces[20]. Several procedures and activities were significantly simplified as compared to standard internet banking[1][7]. The learning slope necessary to comprehend all alternatives & realise all services was decreased by a factor of seven, starting from one hour forty-five minutes to only a quarter-hour. Our customer satisfaction rating climbed by about 320 percent. Eighty-five percent more people used additional banking services[8][9]. The rate of Ready-To-Recommend jumped by 460 percent. The willingness to switch banks has decreased by one-sixth.
